

Mi ne parolas Esperanton

Lili is learning Esperanto and now she wants your help to convert numbers less than 10000 from digit to words in the language. Fortunately the number system in Esperanto is quite simple, it is arguably simpler than in English or Indonesian. The following tables show how to say some numbers in Esperanto:

| 1 | unu |
|---|------|
| 2 | du |
| 3 | tri |
| 4 | kvar |
| 5 | kvin |
| 6 | ses |
| 7 | sep |
| 8 | ok |
| 9 | na |

| 10 | dek |
|----|---------------------|
| 20 | dudek |
| 30 | tridek |
| 40 | kvardek |
| 50 | kvindek |
| 60 | sesdek |
| 70 | sepdek |
| 80 | o <mark>kdek</mark> |
| 90 | nadek |

| 100 | cent |
|-----|----------|
| 200 | ducent |
| 300 | tricent |
| 400 | kvarcent |
| 500 | kvincent |
| 600 | sescent |
| 700 | sepcent |
| 800 | okcent |
| 900 | nacent |
| | |

| 1000 | mil |
|------|----------|
| 2000 | du mil |
| 3000 | tri mil |
| 4000 | kvar mil |
| 5000 | kvin mil |
| 6000 | ses mil |
| 7000 | sep mil |
| 8000 | ok mil |
| 9000 | na mil |
| | |

Notice that:

- There's a pattern, for example sescent (600) is a combination of ses (6) and cent (100).
- There are **no** spaces in *dudek*, *tridek*, etc. and *ducent*, *tricent*, etc. but there **is** one in *du mil*, *tri mil*, etc.

All other numbers less than 10000 that aren't in the table can be formed in a predictable way, here are some examples (more examples can be seen in sample input/output):

- $17 = \mathbf{dek} \ \mathbf{sep}$, from $dek \ (10)$ and $sep \ (7)$.
- $69 = \mathbf{sesdek} \ \mathbf{na}$, from $sesdek \ (60)$ and $na \ (9)$.
- $101 = \mathbf{cent} \ \mathbf{unu}$, from $cent \ (100)$ and $unu \ (1)$.
- 123 = **cent dudek tri**, from cent (100), dudek (20) and tri (3).
- 420 = kvarcent dudek, from kvarcent (400) and dudek (20).

No part of the materials available may be copied, photocopied, reproduced, translated, or reduced to any electronic medium or machine-readable form, in whole or in part, without prior written consent of School of Computer Science - BINUS. Any other reproduction in any form without the permission of School of Computer Science - BINUS is probihited. For those who violated this disclaimer, academic sanctioned can be enforced.

- 1005 = mil kvin, from mil (10) and kvin (5).
- 1111 = mil cent dek unu, from mil (1000), cent (100), dek (10) and unu (1).
- 1337 = mil tricent tridek sep, from mil (1000), tricent (300), tridek (30) and sep (7).

Format Input

The first line contains a single number T, the number of testcases. Each testcase contains a number N, which is the number to be converted to words.

Format Output

For each testcase, output one line starting with "Case #X:" (without quotes) where X is the testcase number (starting from 1) followed by the number after being converted to words.

You might have noticed that Esperanto has the letter "which doesn't exist in both English and Indonesian, so to keep things simple on your program please just use the normal 'u' as a substitute for ".

Constraints

- $1 \le T \le 5000$
- $1 \le N \le 9999$

Sample Input 1 (standard input)

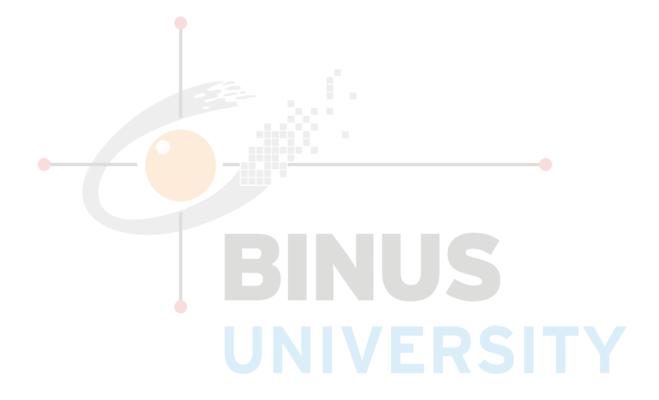

| 10 | |
|------|-------------|
| 5 | |
| 10 | OITIVERSIII |
| 700 | |
| 1100 | |
| 2000 | |
| 2019 | |
| 2020 | |
| 6105 | |
| 7980 | |
| 9999 | |

Sample Output 1 (standard output)

Case #1: kvin
Case #2: dek
Case #3: sepcent
Case #4: mil cent
Case #5: du mil
Case #6: du mil dek nau
Case #7: du mil dudek
Case #8: ses mil cent kvin
Case #9: sep mil naucent okdek
Case #10: nau mil naucent naudek nau

Mi ne parolas Esperanton

Lili sedang mempelajari bahasa Esperanto dan sekarang ia ingin meminta bantuanmu untuk mengubah bilangan di bawah 10000 dari angka ke kata dalam bahasa tersebut. Untungnya sistem bilangan dalam bahasa Esperanto cukup sederhana, bisa dibilang lebih sederhana dari bahasa Inggris ataupun bahasa Indonesia. Tabel berikut menunjukkan cara menyebut beberapa angka dalam bahasa Esperanto:

| 1 | unu | 10 | dek |
|---|------|----|---------|
| 2 | du | 20 | dudek |
| 3 | tri | 30 | tridek |
| 4 | kvar | 40 | kvardek |
| 5 | kvin | 50 | kvindek |
| 6 | ses | 60 | sesdek |
| 7 | sep | 70 | sepdek |
| 8 | ok | 80 | okdek |
| 9 | na | 90 | nadek |

| 100 | cent |
|-----|----------|
| 200 | ducent |
| 300 | tricent |
| 400 | kvarcent |
| 500 | kvincent |
| 600 | sescent |
| 700 | sepcent |
| 800 | okcent |
| 900 | nacent |

| 1000 | mil |
|------|----------|
| 2000 | du mil |
| 3000 | tri mil |
| 4000 | kvar mil |
| 5000 | kvin mil |
| 6000 | ses mil |
| 7000 | sep mil |
| 8000 | ok mil |
| 9000 | na mil |

Perhatikan bahwa:

- Ada sebuah pola, misalnya sescent (600) adalah gabungan dari ses (6) dan cent (100).
- Tidak terdapat spasi pada dudek, tridek, dll. dan ducent, tricent, dll. akan tetapi ada spasi di du mil, tri mil, dll.

Semua bilangan lain di bawah 10000 yang tidak terdapat pada tabel di atas dapat dibentuk dengan cara yang mudah ditebak, berikut adalah beberapa contoh (contoh lainnya dapat dilihat di sample input/output)

- $17 = \mathbf{dek} \ \mathbf{sep}, \ \mathbf{dari} \ dek \ (10) \ \mathbf{dan} \ sep \ (7).$
- $69 = \mathbf{sesdek} \ \mathbf{na}, \ \operatorname{dari} \ sesdek \ (60) \ \operatorname{dan} \ na \ (9).$
- $101 = \mathbf{cent} \ \mathbf{unu}, \, \mathbf{dari} \ cent \ (100) \, \mathbf{dan} \ unu \ (1).$
- 123 = cent dudek tri, dari cent (100), dudek (20) dan tri (3).

[©] School of Computer Science - BINUS, 2020. No part of the materials available may be copied, photocopied, reproduced, translated, or reduced to any electronic medium or machine-readable form, in whole or in part, without prior written consent of School of Computer Science - BINUS. Any other reproduction in any form without the permission of School of Computer Science - BINUS is probihited. For those who violated this disclaimer, academic sanctioned can be enforced.

- 420 = kvarcent dudek, dari kvarcent (400) dan dudek (20).
- 1005 = mil kvin, dari mil (10) dan kvin (5).
- 1111 = mil cent dek unu, dari mil (1000), cent (100), dek (10) dan unu (1).
- 1337 = mil tricent tridek sep, dari mil (1000), tricent (300), tridek (30) dan sep (7).

Format Input

Baris pertama berisi sebuah bilangan T, yaitu jumlah testcase. Setiap testcase mengandung bilangan N, yaitu bilangan yang akan diubah menjadi kata.

Format Output

Untuk setiap testcase, tampilkan satu buah baris yang dimulai dengan "Case #X:" (tanpa kutip) dimana X adalah nomor testcase (dimulai dari 1) kemudian diikuti oleh bilangan tersebut setelah diubah menjadi kata.

Kamu mungkin sudah memperhatikan bahwa bahasa Esperanto mempunyai huruf "yang tidak ada baik dalam bahasa Inggris maupun dalam bahasa Indonesia, sehingga untuk membuat soal ini tetap sederhana pada program kamu gunakan saja huruf 'u' biasa sebagai pengganti ".

Constraints

- $1 \le T \le 5000$
- 1 < N < 9999
